Repair of a urinary vaginal fistula: procedure-specific information

What is the evidence base for this information?

This leaflet includes advice from consensus panels, the British Association of Urological Surgeons, the Department of Health and evidence-based sources; it is, therefore, a reflection of best practice in the UK. It is intended to supplement any advice you may already have been given by your urologist or nurse specialist as well as the surgical team at Addenbrookes. Alternative treatments are outlined below and can be discussed in more detail with your Urologist or Specialist Nurse.

What does the procedure involve?

Surgical closure of an abnormal connection (resulting in a urinary leak) between the vagina and the bladder or ureter

What are the alternatives to this procedure?

Urine diversion by bladder catheter/nephrostomy, ileal conduit urinary diversion, observation, very occasionally closure of the vagina (colpocleisis)

What should I expect before the procedure?

A pre-clerking appointment will also be sent to you to assess your general fitness, to screen for the carriage of MRSA and to perform some baseline investigations.

You will usually be admitted on the same day as your surgery. After admission, you will be seen by members of the medical team which may include the Consultant, Specialist Registrar, House Officer, your named nurse and possibly a Urology Nurse Specialist. You will also be seen by the anaesthetist before the operation.

You will be given intravenous antibiotics at the time the anaesthetic is given, and possibly after surgery too.

You will be asked not to eat or drink for 6 hours before surgery and, immediately before the operation, you may be given a pre-medication by the anaesthetist which will make you dry-mouthed and pleasantly sleepy.
You will be given an injection under the skin of a drug (Dalteparin), that, along with the help of elasticated stockings provided by the ward, will help prevent thrombosis (clots) in the veins.

Please be sure to inform your Urologist in advance of your surgery if you have any of the following:

- an artificial heart valve
- a coronary artery stent
- a heart pacemaker or defibrillator
- an artificial joint
- an artificial blood vessel graft
- a neurosurgical shunt
- any other implanted foreign body
- a prescription for Warfarin, Aspirin or Clopidogrel (Plavix®)
- a previous or current MRSA infection
- high risk of variant CJD (if you have received a corneal transplant, a neurosurgical dural transplant or previous injections of human-derived growth hormone)

What happens during the procedure?

Normally, a full general anaesthetic will be used and you will be asleep throughout the procedure. In some patients, the anaesthetist may also use an epidural anaesthetic which produces freedom from pain post-operatively.

If your surgeon has decided to close a bladder fistula from below, the procedure will be performed entirely through the vagina, following which a pack is usually left in place in the vagina.

Occasionally, if the fistula is very close to the ureteric orifice or orifices (the exit of the ureter carrying urine from your kidney to your bladder), your surgeon may need to reimplant the ureter or both ureters elsewhere into the bladder. Usually, as part of the procedure, your surgeon will place stents within the ureters and these maybe in place at the end of surgery.
Usually, an abdominal approach is necessary and the procedure will be performed through either a vertical or a transverse incision in your lower abdomen. The fistula is dissected out and the connection between the urinary tract and the vagina divided. It is usual to position part of the fatty envelope from inside the abdomen (the omentum) to prevent the fistula from recurring.

**What happens immediately after the procedure?**

The average stay in hospital will last approximately 7-10 days.

Two catheters will probably be placed in the bladder for up to three weeks, one via the urethra and one (suprapubic catheter) via a small incision in the skin over the bladder. There will be a drainage tube close to the wound, to drain fluid away from the internal area where the operation has been done. A tube may be placed through the nose to drain the stomach.

After your operation, you may be in the Special Recovery area of the operating theatre before returning to the ward; visiting times in these areas are flexible and will depend on when you return from the operating theatre. You will have a drip in your arm.

You will be encouraged to mobilise as soon as possible after the operation because this encourages the bowel to begin working. We will start you on fluid drinks and food as soon as possible.

Normally, we use elastic stockings to minimise the risk of a blood clot (deep vein thrombosis) in your legs. A physiotherapist will come and show you some deep breathing and leg exercises, and you will sit out in a chair for a short time soon after your operation.

**Are there any side-effects?**

Most procedures have a potential for side-effects. You should be reassured that, although all these complications are well-recognised, the majority of patients do not suffer any problems after a urological procedure. Please use the check boxes to tick off individual items when you are happy that they have been discussed to your satisfaction

**Common (greater than 1 in 10)**

- Infection or hernia of the incision requiring further treatment
- Altered bladder function in the short- or long-term.

**Occasional (between 1 in 10 and 1 in 50)**

- Blood loss requiring transfusions or repeat surgery
- Failure of the operation with leakage of urine through the vagina, requiring re-operation
- Scarring of the ureters requiring further surgery
- New bladder symptoms of frequency and urgency
Rare (less than 1 in 50)
- Anaesthetic or cardiovascular problems possibly requiring intensive care admission (including chest infection, pulmonary embolus, stroke, deep vein thrombosis, heart attack and death)

Hospital-acquired infection (overall risk for Addenbrooke’s)
- Colonisation with MRSA (0.01%, 2 in 15,500)
- Clostridium difficile bowel infection (0.02%; 3 in 15,500)
- MRSA bloodstream infection (0.00%; 0 in 15,000)

(These rates may be greater in high-risk patients e.g. with long-term drainage tubes, after removal of the bladder for cancer, after previous infections, after prolonged hospitalisation or after multiple admissions)

What should I expect when I get home?
When you leave hospital, you will be given a discharge summary of your admission. This holds important information about your inpatient stay and your operation. If, in the first few weeks after your discharge, you need to call your GP for any reason or to attend another hospital, please take this summary with you to allow the doctors to see details of your treatment. This is particularly important if you need to consult another doctor within a few days of your discharge.

You will require pain-killing tablets at home for two or three weeks and it may take two or three weeks at home to become comfortably mobile.

You may go home with one or both catheters still in place, and have a planned return to hospital for these to be removed. If so, you or your carers will be taught how to look after the catheters and the drainage systems for them.

You should avoid driving for at least six weeks, and it may be longer before this is possible.

If you work, you will need a minimum of six weeks off, and it may be significantly longer if your work involves physical activity.

Heavy lifting should be avoided for 6 weeks.

Sexual intercourse should be avoided for at least a month.

You may see blood in the urine or vaginal discharge for up to a month after surgery.

What else should I look out for?
If you go home with catheters, you or your carers should check regularly to ensure that urine is draining via the catheters, which confirms that the catheters have not blocked. If the catheters both block this can put pressure on the suture line in the
bladder, and so the catheters would need to be flushed and unblocked very promptly. Are there any other important points? Usually, 3-4 weeks after surgery, you will be readmitted to have an x-ray dye test (a cystogram) to check that the bladder has healed. At a later date, you may also have to reattend hospital to have the ureteric stents removed. This is typically undertaken whilst you are awake using a flexible telescope into the bladder (flexible cystoscopy).

A follow-up outpatient appointment will be arranged at about 6-8 weeks after surgery.

**Driving after surgery**

It is your responsibility to ensure that you are fit to drive following your surgery. You do not normally need to notify the DVLA unless you have a medical condition that will last for longer than 3 months after your surgery and may affect your ability to drive. You should, however, check with your insurance company before returning to driving. Your doctors will be happy to provide you with advice on request.

**Privacy & Dignity**

Same-sex bays and bathrooms are offered in all wards except critical care and theatre recovery areas where the use of high-tech equipment and/or specialist one-to-one care is required.

**Hair removal before an operation**

For most operations, you do not need to have the hair around the site of the operation removed. However, sometimes the healthcare team may need to remove hair to allow them to see or reach your skin. If the healthcare team consider it is important to remove the hair, they will do this by using an electric hair clipper, with a single-use disposable head, on the day of the surgery. Please do not shave the hair yourself, or use a razor for hair removal, as this can increase the risk of infection to the site of the operation. If you have any questions, please ask the healthcare team who will be happy to discuss this with you.

**Is there any research being carried out in this field at Addenbrooke’s Hospital?**

There is no specific research in this area at the moment but all operative procedures performed in the department are subject to rigorous audit at a monthly Audit & Clinical Governance meeting.
Who can I contact for more help or information?

**Oncology Nurses**

Uro-Oncology Nurse Specialist  
01223 586748
- Bladder cancer Nurse Practitioner (haematuria, chemotherapy & BCG)  
  01223 274608
- Prostate cancer Nurse Practitioner  
  01223 274608 or 216897 or bleep 154-548
- Surgical Care Practitioner  
  01223 348590 or 256157 or bleep 154-351

**Non-Oncology Nurses**

- Urology Nurse Practitioner (incontinence, urodynamics, catheter patients)  
  01223 274608 or 586748 or bleep 157-237
- Urology Nurse Practitioner (stoma care)  
  01223 349800
- Urology Nurse Practitioner (stone disease)  
  01223 349800 or bleep 152 879

**Patient Advice & Liaison Centre (PALS)**

- Telephone: +44 (0)1223 216756 or 257257  
  +44 (0)1223 274432 or 274431
- PatientLine: *801 (from patient bedside telephones only)
- E mail: pals@addenbrookes.nhs.uk
- Mail:  PALS, Box No 53  
  Addenbrooke's Hospital  
  Hills Road, Cambridge, CB2 2QQ

**Chaplaincy and Multi-Faith Community**

- Telephone: +44 (0)1223 217769
- E mail: chaplaincy@addenbrookes.nhs.uk
- Mail:  The Chaplaincy, Box No 105  
  Addenbrooke's Hospital  
  Hills Road, Cambridge, CB2 2QQ

**MINICOM System ("type" system for the hard of hearing)**

- Telephone: +44 (0)1223 217589
Access Office (travel, parking & security information)
• Telephone: +44 (0)1223 596060

What should I do with this form?
Thank you for taking the trouble to read this information sheet. If you wish to sign it and retain a copy for your own records, please do so below.

If you would like a copy of this form to be filed in your hospital records for future reference, please let your Urologist or Specialist Nurse know. If you do, however, decide to proceed with the scheduled procedure, you will be asked to sign a separate consent form which will be filed in your hospital notes and you will, in addition, be provided with a copy of the form if you wish.

I have read this information sheet and I accept the information it provides.
