## Nocturnal polyuria: frequently-asked questions

### Why does it happen?

Nocturnal polyuria means passing large volumes of urine at night but normal amounts during the day. There are a number of possible reasons why you may need to get up at night to pass urine; these may include:

- poor sleep patterns
- your bladder or prostate are causing you trouble
- you are producing too much urine at night (nocturnal polyuria)
- any combination of the above

### What will the doctor ask me to do?

In order for your doctor to work out the main cause for your symptoms, he/she will ask you to complete a frequency/volume chart (voiding diary) on which you record the time and amount of urine you pass every time you go to the toilet as well as the amount of fluid you consume.

### Why do I produce too much urine at night?

The body normally produces a chemical from the brain at night which tells the kidneys to cut down the amount of urine produced whilst you are asleep. This chemical is called antidiuretic hormone (or ADH). When you are young, ADH reduces urine production so that you produce less than a fifth of the 24-hour total at night.

---

As you get older, especially after the age of 65, you should still be producing less than a third of your total urine output at night. When you produce too much urine overnight (i.e. more than one third of the daily total), this is called nocturnal polyuria. There are a number of causes:

- you may not be producing enough ADH (vasopressin)
- you drink too much in the evening; this may include eating foods with a high water content (e.g. fruit, vegetables, salads, pasta & rice)
- you use the night-time to get rid of any excess water from your body.

Many people develop swelling or puffiness of the ankles in the evening but notice that they are normal, or less puffy, in the morning. This is because, when you lie down, the water which causes the puffiness passes into the bloodstream and is converted into urine by the kidneys. Once this urine is passed to the bladder, it wakes you up during the night with a full bladder.

### **How can I help myself?**

Your doctor will, of course, ask you about your eating and drinking habits in the evening and will examine you to see if there is any ankle swelling. However, there are some things you can do yourself:

- adjust your drinking and eating to take in less fluid in the evening
- eat most of your water-containing food earlier in the day
- if your ankles are swollen, put your feet up as often as possible to help your body get rid of the water during the day; this is not, however, an invitation to become a "couch potato"
- increase your exercise levels (especially walking) because this helps to push excess fluid back into the circulation where it belongs

### **What if these simple measures do not help?**

If you have tried your best to deal with the problem but you still produce too much urine at night, your doctor may try to help you by:

- prescribing a water tablet (diuretic) which makes your kidneys produce more urine. If this is given at tea-time, it can encourage your kidneys to expel the excess water in the evening instead of at night, so you sleep better
- prescribing synthetic ADH (either in tablet form or as a nasal spray) taken just before bed-time. This must be used with caution in older people because it may precipitate water retention which can put strain upon the heart in patients with heart problems or high blood pressure.
- prescribing a special tablet (Imipramine) to inhibit bladder activity (often used in children who wet the bed at night)

---

## What if I have other concerns?

If you have any concerns or worries about your symptoms or about any other aspect of this problem, you should always discuss them with your GP, Specialist Nurse or urologist.

## Who can I contact for more help or information?

### Oncology Nurses

- Uro-Oncology Nurse Specialist  
01223 586748
- Bladder cancer Nurse Practitioner (haematuria, chemotherapy & BCG)  
01223 274608
- Prostate cancer Nurse Practitioner  
01223 274608

### Non-Oncology Nurses

- Urology Nurse Practitioner (incontinence, urodynamics, catheter patients)  
01223 274608 or 586748

### Patient Advice & Liaison Centre (PALS)

- Telephone  
+44 (0)1223 216756 or 257257  
+44 (0)1223 274432 or 274431
- PatientLine  
\*801 (*from patient bedside telephones only*)
- E mail  
pals@addenbrookes.nhs.uk
- Mail  
PALS, Box No 53  
Addenbrooke's Hospital  
Hills Road, Cambridge, CB2 2QQ

### Chaplaincy and Multi-Faith Community

- Telephone  
+44 (0)1223 217769
- E mail  
derek.fraser@addenbrookes.nhs.uk
- Mail  
The Chaplaincy, Box No 105  
Addenbrooke's Hospital  
Hills Road, Cambridge, CB2 2QQ

### MINICOM System ("type" system for the hard of hearing)

- Telephone  
+44 (0)1223 274604

---

## Access Office (travel, parking & security information)

- Telephone  
+44 (0)1223 586969

## Other information

This leaflet contains guidelines and advice from professional bodies, together with information about the prescription of drugs. All NHS hospitals have local arrangements with their Primary Care Trusts (PCTs) about which medicines can be used. As a result, some drugs mentioned cannot be prescribed by local hospitals.

Treatment of patients will be planned with the Consultant responsible for care, taking into account those drugs which are or are not available at the local hospital and what is appropriate for optimum patient care.

Healthcare professionals are advised to check prescribing arrangements with their local hospital or PCT.
