

Trial without catheter (TWOC): frequently-asked questions

What is a trial without catheter?

A trial without catheter is when a catheter which has been inserted via the urethra (water pipe) is removed from the bladder for a trial period to determine whether you are able to pass urine spontaneously.

What will happen once the catheter has been removed?

You will be encouraged to fill your bladder slowly by drinking sufficient fluid. This normally entails drinking a glass or cupful of liquid approximately every 45-60 minutes.

Do I have to stay in hospital during this time?

Not necessarily although, by remaining in hospital, this allows us to monitor your condition closely. If you live locally, you may be able to return home after the catheter has been removed; alternatively, you can leave the clinic but remain within the hospital so that you can return to the Clinic at any time.

What happens if I cannot pass urine?

If you are unable to pass urine, a new catheter may be inserted or, with your agreement, you may be taught intermittent self-catheterisation.

If you require re-catheterisation, you will be automatically referred back to your Consultant Urologist for further advice.

If self-catheterisation is required, your Specialist Nurse will provide you with everything you need for this and will continue to monitor your progress at subsequent outpatient appointments.
